Abstract *Allaeotes niger* He, Zhang & Pelsue, 2003 is recorded from Japan for the first time as the first representative of the genus, based on specimens collected from Miyako-jima Island, the Ryukyus. Habitus and diagnostic images and figures are provided.

The dryophthorid subfamily Stromboscerinae comprises small, strongly sculptured, slow-moving weevils that typically inhabit the forest litter in South and Southeast Asia, Japan, and Madagascar. The 13 extant genera are currently assigned to the subfamily (Grebennikov, 2018). *Allaeotes* Pascoe, 1885 is one of the smallest genera, containing only two known species: the type species, *A. griseus* Pascoe, 1885 from Ambon, Indonesia, and the second species, *A. niger* He, Zhang & Pelsue, 2003 from southeastern China. This genus is characterized by the following features: antennal club obliquely truncate, the tomentose apical surface flat; eyes contiguous beneath; and antennal funicle with 6 segments (Morimoto, 1978).

In our surveys conducted in the Miyako Islands, the Ryukyus, Japan, the second author collected an unknown stromboscerine weevil under the bark of a fallen pine tree, *Pinus luchuensis*. After close examination, the weevil was identified as *A. niger*.

In this paper, we will record this species from Japan for the first time as the first representative of the genus *Allaeotes*.

Specimens are deposited in the Laboratory of Entomology, Tokyo University of Agriculture, Atsugi.

Genus *Allaeotes* Pascoe, 1885

Allaeotes Pascoe, 1885: 312 (type species: *A. griseus* Pascoe, 1885; Cossoninae); Csiki, 1936: 115 (Cossoninae, Cossonini, Pentarthri; catalogued); Morimoto, 1978: 104 (Rhynchophoridae, Dryophthorinae, Stromboscerini; in key); Alonso-Zarazaga & Lyal, 1999: 68 (Dryophthoridae, Stromboscerinae; catalogued); Lyal, 2011: 192 (Dryophthoridae, Stromboscerinae; catalogued); Alonso-Zarazaga *et al.*, 2017: 244 (Curculionidae, Dryophthorinae, Stromboscerini; catalogued); Grebennikov, 2018: 126 (reviewed and figured).

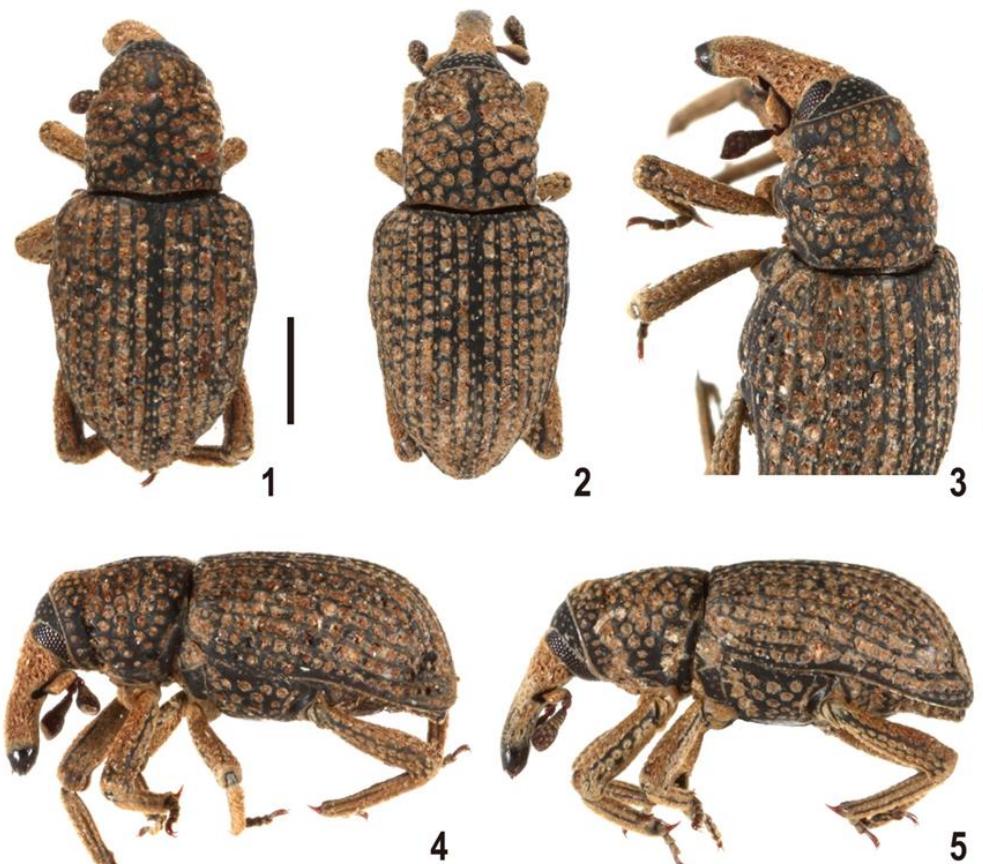

Allaeotes niger He, Zhang & Pelsue, 2003 (Figs. 1-9)

Allaeotes niger He, Zhang & Pelsue, 2003: 127 (type locality: "Mt. Jiulianshan, Longnan Country, Jiangxi Province, China"); Lyal, 2011: 192 (catalogued); Alonso-Zarazaga *et al.*, 2017: 244 (catalogued).

Additional description. Length: 3.00-4.20 mm. Prothorax 1.05-1.10 times as long as broad. Elytra 1.30-1.35 times as long as broad, with 9th and 10th intervals weakly projected laterally at basal 1/4, where elytra are broadest. Fully winged. Internal sac of aedeagus spinulate.

Specimens examined. 1 male & 3 females, Ôno-sanrin, Miyako-jima Is., 20.VIII.2011, Y. Fujisawa.

Distribution. Japan (Ryukyus: Miyako-jima Is.)-new record; China (Jiangxi, Zhejiang, Fujian and Guangdong provinces).

Figs. 1-5. Habitus images of *Allaeotes niger* from Miyako-jima Is., the Ryukyus, Japan. 1, Male, dorsal; 2, female, dorsal; 3, male, dorso-lateral; 4, male, lateral; 5, female, lateral. Scale: 1.0 mm.

Natural history. The examined specimens were found under the bark of a fallen pine tree, *Pinus luchuensis* (Pinaceae; Ryūkyūmatsu in Japanese).

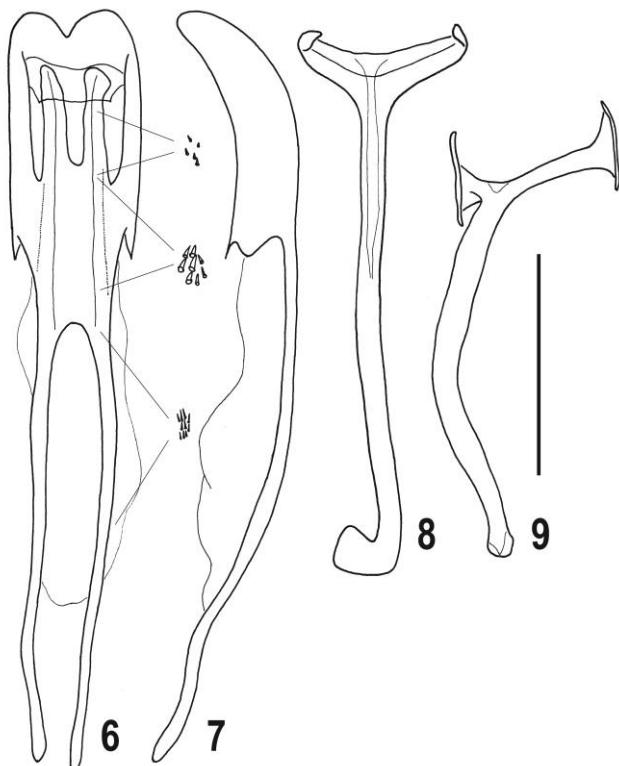

Comments. Japanese specimens are slightly larger (3.90-4.20 mm in length) than those from China (3.00-3.90 mm). However, the size difference is considered to be intraspecific variation.

This species is easily distinguishable from the type species by its robust body: pronotum slightly longer than broad (1.30 times longer than broad in *A. griseus*), and elytra approximately 1.30 times as long as broad (about 1.50 times as long as broad in *A. griseus*).

Curiously enough, this species is very similar to an undetermined species from Cuba depicted by Grebennikov (2018; fig. 12B) as the first representative of Stromboscerinae from the Western Hemisphere.
